

Dashboard Napkin Drawing and Feedback

Feedback

Charlie Rehder:

After giving Charlie an explanation of our dashboard on May 11th, he noted that we were missing a representation of our ML model in the dashboard. We did not realize that the ML model needed to be represented in the dashboard, so his feedback was very helpful. We went back to the drawing board and created an area for a graph to show our model prediction versus the actual unemployment.

Alysia Halverson:

Alysia also mentioned that the ML model needed to be somehow represented in the dashboard and suggested we graph the prediction versus the test data and display it with our other graphs. Otherwise she said she liked the overall style of our dashboard and the way the data will be represented.

Jakob Thunen:

Jakob was the third to mention that an ML model representation was needed. He also said that he liked that we would have attention grabbing numbers at the top as simple representations of our findings and that he liked the more in-depth graphs at the bottom.

Overall, we were able to take their feedback to come up with a better napkin drawing that would represent our analysis, including the ML model.
